

Chronopoli

The Global Knowledge City for the digital economy,
hosted by Dubai Blockchain Center

**AI-Native Knowledge Infrastructure ·
Community Intelligence Engine · Verified Credentials**

Digital assets · AI · Governance · Risk & trust ·
Financial-crime investigation · Compliance · Emerging tech

Hosted in the UAE · September 2026

The product tour uses an illustrative Tether (USDT) academy: fictitious mock data, no partnership implied

● DESIGN PROTOTYPE

Landing-page preview (not yet deployed)

The digital economy has a structural knowledge gap

No one connects digital assets, AI, governance, risk and investigation in one trusted, neutral place

Fragmentation

Stablecoin infrastructure, AI governance, regulation, risk and forensics sit in silos; no single platform connects them

OUR ANSWER

Seven districts, four layers, one onboarding

Slides 3, 7

Speed Mismatch

MiCA and FATF change, DeFi exploits create new typologies. Universities take 18 months to update, training firms 6; the market moves daily

OUR ANSWER

Updates in under 48 h: course authoring + pipeline

Fake Credentials

A certificate says you sat in a room. It tells no employer what you know today, in context, for your jurisdiction

OUR ANSWER

Open Badges 2.0 linked to partner roles

Slide 13

No Neutral Convener

Nobody puts an issuer, a UAE regulator, a forensics analyst and a researcher in one room and turns that into institutional knowledge

OUR ANSWER

Symposia: round tables that publish

Slides 18, 19

One city, seven districts, four layers

Every course sits in a Knowledge District and a learning layer, so every learner and partner knows where they belong

- 7 Knowledge Districts: AI, Digital Assets, Governance, Compliance, Investigation, Risk & Trust, Emerging Tech
- 4 learning layers set depth and price (below)
- Partners publish tracks into several districts and can run their own academy on a partner subdomain
- One account for courses and community

LEARNING LAYERS: DEPTH AND PRICE RISE TOGETHER

DESIGN PROTOTYPE

Landing-page preview of the seven districts (not yet deployed)

Three pillars, one platform

Every feature serves the network effect: more partners → more content → smarter AI → more value

Symposia

Community Intelligence Engine

- Live round tables under the Chatham House Rule, streamed live
- Automated opinion papers in 3 hours
- LinkedIn and Instagram content, one human approves (TikTok: roadmap)
- Partner Intelligence Reports per session

The course page for 'Stablecoin Compliance: AML/CFT and the Travel Rule' is displayed. It includes a title, a brief description, an 'Enroll now' button, and a list of modules. A sidebar on the right shows course details like 'USDT-201', 'L2 Professional', '14 h', and 'USD 599'.

Stablecoin Compliance: AML/CFT and the Travel Rule
Chronopoli · Compliance District

AML/CFT, sanctions screening and FATF Travel Rule controls for VASPs handling stablecoins. 6 modules, graded capstone.

[Enroll now](#)

About this course

Stablecoin Compliance: AML/CFT and the Travel Rule is part of the **Tether Stablecoin Infrastructure Academy** on Chronopoli, hosted in the Compliance District (CHRON-COMP), learning layer L2 (Professional).

Effort: 14 h. Price: USD 599.

Illustrative demo course. Tether/USDT course names, people, organisations and figures are fictitious mock data for the Chronopoli pitch; Tether is on the partner roadmap only and no partnership is implied.

Modules

1. How a fiat-backed stablecoin works
2. Risk-based approach for VASPs
3. Freeze controls and sanctions screening
4. The Travel Rule in practice (FATF R.16)
5. Monitoring and red flags
6. Capstone case study (graded, pass >= 70%)

An AI tutor that cites its sources

The AI tutor answers inside the lesson, from the Chronopoli knowledge base, and shows its sources

The screenshot shows a web application for learning about cryptocurrency compliance. The URL is `apps.learn.chronopoli.io/learning/course/course-v1:CHRON-COMP+USDT-2...`. The page title is "3.1 Screening and the freeze decision". The course outline on the left lists six topics, with the third topic, "Freeze controls and sanctions screening", selected. The main content area explains that some fiat-backed stablecoins are issued by smart contracts that include an administrative freeze (or blacklist) function. It states that when the issuer adds an address to that list, tokens held there can no longer be transferred. Issuers typically use it in response to law-enforcement requests or sanctions designations. A key point is that for a VASP, an issuer-level freeze is not a substitute for its own controls. The freeze acts on the token; your obligations act on your customers and counterparties. You still need to screen, decide, report and keep a record of why. A knowledge check 3.2 is mentioned, where you will work through a case in which a customer attempts to send USDT to an address on a sanctions list, and decide what the compliance team should do first. The Chronopoli AI Tutor is visible in the bottom right corner, showing a welcome message and a question about what happens to funds already sent to a sanctioned USDT address. The tutor's answer is displayed, stating that stablecoin issuers with freeze functionality can block a listed address at contract level, so tokens held there can no longer be transferred. The tutor also cites sources: USDT-201 Lesson 3.1 and FATF R.15 guidance summary.

Course > Module 3: Freeze controls and sanctions screening > Lesson 3.1

3.1 Screening and the freeze decision

Reading · 12 min · Unit 1 of 1

Some fiat-backed stablecoins are issued by smart contracts that include an administrative **freeze** (or blacklist) function. When the issuer adds an address to that list, tokens held there can no longer be transferred. Issuers typically use it in response to law-enforcement requests or sanctions designations.

For a VASP, an issuer-level freeze is not a substitute for its own controls. The freeze acts on the token; your obligations act on your customers and counterparties. You still need to screen, decide, report and keep a record of why.

Key points

- Screen counterparty addresses against sanctions lists before you settle, not after.
- An issuer freeze is a signal to review exposure, not proof that your controls worked.
- File with your FIU where required and document the decision trail for audit.

In Knowledge check 3.2 you will work through a case in which a customer attempts to send USDT to an address on a sanctions list, and decide what the compliance team should do first.

← Module 2 summary

Next: 3.2 Knowledge check →

Chronopoli AI Tutor

Welcome to the Chronopoli AI Tutor. I can answer questions about your courses, the platform, and the digital economy. How can I help?

If a USDT address is sanctioned, what happens to funds already sent to it?

Stablecoin issuers with freeze functionality can block a listed address at contract level, so tokens held there can no longer be transferred. Your obligations as a VASP are separate: screen counterparties before settlement, file a report with your FIU and document the decision trail. Knowledge check 3.2 walks you through this case.

Sources: USDT-201 Lesson 3.1, FATF R.15 guidance summary

Ask anything about the course...

The screenshot shows a question in a yellow box: "If a USDT address is sanctioned, what happens to funds already sent to it?". The AI tutor's answer is displayed in a dark box, stating that stablecoin issuers with freeze functionality can block a listed address at contract level, so tokens held there can no longer be transferred. The tutor also cites sources: USDT-201 Lesson 3.1 and FATF R.15 guidance summary.

Stablecoins as Settlement Rails in the GCC

CONFIRMED Initiated by Dr. Amira Haddad Nov 12, 2026 12:00 UTC 90 min

Description

A closed-door round table on whether USD-backed stablecoins can serve as settlement rails for cross-border trade, remittances and treasury flows in the GCC, and what central banks, issuers and exchanges need to see first.

Agenda

12:00 UTC (16:00 GST) Welcome; the session is held under the Chatham House Rule
12:10 Where stablecoin settlement already works: remittances, trade, treasury
12:35 The central bank view: monetary sovereignty, reserves and supervision
13:00 The exchange view: liquidity, freeze controls and the Travel Rule
13:20 Open discussion and policy recommendations
13:30 Close

Districts: CHRON-DA CHRON-GOV

How the licence works

- One seat = one named learner in the academy
- Seats can be reassigned when someone leaves the team
- Adding seats updates the Stripe subscription quantity

DESIGN PROTOTYPE

Team licence page (not yet built)

- **Gulf Digital Exchange:** 25 seats × \$125 = \$3,125 a month

70% of every partner-course sale goes to the partner, automatically

secure hosted checkout splits each checkout at the moment of payment

Illustrative Q3: \$1,108,440 gross from 1,610 paid enrolments

\$775,908

to the partner (70%)

\$332,532

to Chronopoli (30%)

- One payout record per purchase, split by course; buyer emails are masked for partners

What one academy could look like (illustrative)

Fictitious Tether scenario, Q3 2026: demo numbers that show the mechanics, not traction

Gross individual sales by course, Q3 2026 (USD, illustrative)

The free USDT-101 is the funnel: 2,140 of 4,812 enrolments (44%)

Neutral cross-sector positioning	×	—	×	✓	Slides 3, 33

✓ yes — partial × no

Competitor ratings: Chronopoli Master Document. Chronopoli column: built in code, going live with the plan; the 48-hour update is a design target.

Three self-reinforcing moats

Each moat strengthens the other two: the longer the platform runs, the harder it is to replicate

Proprietary Knowledge Moat

Every round table, opinion paper and masterclass feeds the AI Tutor. After 12 months, no external AI, not ChatGPT, not Gemini, has access to this knowledge base. It compounds like interest.

In this deck: slides 11, 19

Partner Lock-in Moat

When a partner builds its academy inside Chronopoli, its credential history, talent pipeline and community are embedded. Leaving means giving up its own institutional knowledge base.

In this deck: slides 8, 13

Network Effects Moat

More partners → more round tables → more knowledge → more users → more employer demand → more partners: a two-sided marketplace flywheel in a high-value niche.

In this deck: slides 4, 18

The right people at the right time

Compliance expertise + defence tech + blockchain infrastructure + UAE institutional access

Chris

Co-Founder & COO · Regulatory Client Manager, Bank Frick

BACKGROUND

KYC/AML/EDD expert · FMA Liechtenstein · FINMA Switzerland · UAE VARA · digital-assets compliance across 5+ jurisdictions

VENTURES & CONTEXT

Co-Founder PHLX AG (Swiss defence tech) · WorldBitEnergy · Dubai Blockchain Center

CTO (to be confirmed)

Co-Founder · platform & infrastructure lead

BACKGROUND

the platform · cloud · Python/Python · AI-pipeline architecture. Search in progress for a world-class technical co-founder with MENA experience

VENTURES & CONTEXT

Platform code-complete via the framework: 15 phases, 90 requirements. What go-live still needs: slide 28

ADVISORS Maria Papadaki (BUID, academic partner) · DBCC leadership · Compliance advisor (TBC) · Regional investor (TBC)

90-day sprint to first revenue

Close two Founding Partners before public launch; the plan (slide 28) is the technical base

 Month counts are master-plan targets. Go-live comes after the launch plan, which are ordered but not yet dated; public launch follows the first two Founding Partners.

Partner roadmap: four tiers, one named focus

What each tier gets. Tether is the one named target partner; no agreements are signed.

TIER	PARTNERS (NONE SIGNED)	WHAT THE TIER GETS
 Founding	Two seats to fill before launch	Flagship tracks or a \$150K Founding Academy, co-hosted symposia, a seat on the curriculum board
 Strategic	Tether (target partner)	Branded academy, pathways and badges, talent pipeline, as in the tour's illustrative academy
 Content	Specialist course providers	Specialist courses inside a district, e.g. investigation, compliance or AI
 Institutional	Universities (BUID MOU in progress), think tanks, banks	Co-certification and research round tables

 Tether is a roadmap target, not an agreement. Status today (slide 28): DBCC confirmed anchor · BUID MOU in progress · Tether target Strategic partner

Raising \$2,000,000 seed round

Pre-money valuation \$8,000,000 · Equity / SAFE · 18-month runway

\$2,000,000

SEED ROUND · \$8M PRE-MONEY · EQUITY / SAFE

USE OF FUNDS

- Sales & partnership team
\$600K · 30%
- Marketing & conferences
\$400K · 20%
- Platform scaling
\$400K · 20%
- G&A, legal, operations
\$600K · 30%

Code-complete

Not a prototype: the feature code is written. Not live yet; go-live follows the plan (slide 28)

Companies pay us

B2B-first: \$150K academy deals fund the model before students pay a dollar

Lean operating model

Projected 67.5% EBITDA margin in Year 1, profitable from month 5 (projection)

UAE tax advantage

9% corporate tax on profits above \$102K, no personal income tax for employees, DBCC as institutional anchor

Become a founding Knowledge Partner

Help build the place where the digital economy learns, hosted by Dubai Blockchain Center

Founding partners

Co-design a flagship track or an academy around the roles you hire for, co-host the first round tables, sit on the curriculum board

Pilot institutions

Regulators, FIUs, banks and VASPs for the first team-licence cohorts, with feedback on L2-L3 content

Investors

Fund the go-live and the first partner academies: the \$2M seed on slide 34

Next step: a working session to choose your district, first track and first round table

Contact: partners@chronopoli.io · chronopoli.io

Chronopoli is not a better Coursera. Not a smarter university.

It is a completely new architecture

where credentials are verifiable, content is AI-generated and regulation-linked, companies fund learning instead of students, and the degree is replaced by a dynamic professional record that follows you for life.
